

A.C.E

PRODUCT DESCRIPTION

A liquid foliar compound mix to purge stress from the plant.

1 K₂O, plus a blend of vitamins A, C and E antioxidants.

UNIQUE BENEFITS

The product, due to its' chemistry is available as a foliar and a root feed.

The plant, when under stress produces excessive amounts of the hormone ethylene. Ethylene in small amounts is necessary for plant function but in large amounts it starts to have a negative effect.

It starts to break down the cells, weakening the plant and allowing disease and pests to penetrate. The product is very effective at reversing this cycle by reducing the amount of ethylene quickly. The anti oxidants mop up the free radicals preventing them doing further harm to the cells.

In times of severe stress the plant closes down and stops functioning, taking up nutritional products becomes difficult, applications of granular products can actually add to the stress. Using the product enables the plant to reset itself and start to function in a natural manner.

TIMING AND MIXING

The product can be applied year round. It is especially useful before and after times of heavy play or before and after stressful renovation work.

The product is tank mixable with all Growing Solutions products.

It can be applied every 4 weeks for maintenance

APPLICATION RATES

1 lts per Ha in 300 lts water.

A.C.E

Our bespoke Vitamin Range which reduces stress and corrects bad plant physiology.

When A.C.E is applied it reverses the ageing process of the plant cells.

This makes a more vigorous and alive plant. Enabling optimum function throughout the plant.

During high stress periods the plant is not able to function normally and begins to shut down.

Excess Ethylene is produced which rapidly ages the plant cells.

A.C.E reduces the stress, allowing the plant to reset and regain functionality naturally.

With reduced stress levels and added vitamins the roots are able to hold onto their conserves of energy. A small signal of K20 is also sent to the roots to stimulate strength.

A.C.E removes excess ethylene from the plant and begins to repair damaged cells. This makes a more vigorous and healthy plant throughout.
